An aliquot of the amplified library was used to transduce E. coli Y1090 and phage DNA was purified from a liquid lysate. The cDNA inserts were gel purified after EcoRI digestion and ligated into pBluescript SK+. Aliquots of the ligation were used to transform E. coli DH5alpha which were plated onto medium with X-gal for selection of recombinants."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             /clome lib="DSCT"
/note="Vector: pBluescript SK+; Site 1: EcoRI; Site 2:
/note="Vector: pBluescript SK+; Site 1: EcoRI; isolate: 2sp2; cDNA was prepared from polyA+
EcoRI; isolate: 2sp2; cDNA was ligated into Lambda gtl1 from
Stratagene and packaged using Gigapack packaging extracts.
An aliquot of the amplified library was used to transduce
E. coli Y1090 and phage DNA was purified from a liquid
lysate. The cDNA inserts were gel purified after EcoRI
digestion and ligated into pBluescript SK+. Aliquots of
the ligation were used to transform E. coli DH5alpha which
were plated onto medium with X-gal for selection of
recombinants."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note="Vector: pBluescript SK+; Site_1: EcoRI; Site_2: EcoRI; isolate: 28p2; cDNA was prepared from polyA+enriched RNA The cDNA was ligated into Lambda gt11 from Stratagene and packaged using Gigapack packaging extracts. An aliquot of the amplified library was used to transduce E. coli Y1090 and phage DNA was purified from a liquid lysate. The cDNA inserts were gel purified after EcoRI digestion and ligated into pBluescript SK+. Aliquots of the ligation were used to transform E. coli DFSalpha which were plated onto medium with X-gal for selection of recombinants."

/note="Vector: pBluescript SK+; Site 1: EcoRI; Site 2:
EcoRI; isolate: 2sp2; cDNA was prepared from polyA+
enriched RNA The cDNA was ligated into Lambda gtl1 from
Stratagene and packaged using Gigapack packaging extracts.
An aliquot of the amplified library was used to transduce
E. coli Y1090 and phage DNA was purified from a liquid
lysate. The cDNA inserts were gel purified after EcoRI
digestion and ligated into pBluescript SK+. Aliquote of
the ligation were used to transform E. coli DH5alpha which
were plated onto medium with X-gal for selection of
recombinants."

/note="Vector: pBluescript SK+; Site 1: EcoRI; Site 2:
/note="Vector: pBluescript SK+; Site 1: EcoRI; Site 2:
EcoRI; isolate: 2sp2; cDNA was prepared from polyA+
enriched RNA The cDNA was ligated into Lambda gtl1 from
Stratagene and packaged using Gigapack packaging extracts.
An aliquot of the amplified library was used to transduce
E. coli Y1090 and phage DNA was purified from a liquid
lysate. The cDNA inserts were gel purified after EcoRI
digestion and ligated into pBluescript SK+. Aliquots of
the ligation were used to transform E. coli DH5alpha which
were plated onto medium with X-gal for selection of
recombinants."

/note="vector: pBluescriptSK: Site 1: EcoRI; Site 2:
XhoI; Unidirectional cloning. EcoRI side has T3 primer and
predominantly 5' reads. T7 primer on XhoI side of insert.
Nitrogen starvation library. Cells were inoculated into
minimal medium and grown for two days with shaking (150
rpm) at room temperature. Culture was harvested, blended,
inoculated into minimal medium as above for 24 h. Cells
were harvested, washed with water and inoculated into
minimal medium base lacking nitrogen source for 6 h.
Sequences were processed by one of two methods. Where a
full-length alignment to the M. grisea genome sequence was
available, the EST sequence was trimed according to the
alignment, otherwise sequence quality was assessed using
phredPhrap version 991019 and trimmed according to phd
files (0.05) and for vector seqs."

ECORI, isolates 1892; cDNA was prepared from polyA+ enriched RNA The cDNA was ligated into Lambda gtl1 from Stratagene and packaged using Gigapack packaging extracts. An aliquot of the amplified library was used to transduce E. coli Y1090 and phage DNA was purified from a liquid lysate. The cDNA inserts were gel purified after EcoRI digestion and ligated into pBluescript Sk+. Aliquots of the ligation were used to transform E. coli DH5alpha which were plated onto medium with X-gal for selection of	<pre>/tissue_type="mycelia" /dev_stage="Young, actively growing mycelia (3 days after inoculation) grown in liquid culture (cutin minimal medium containing 2%glucose)." /lab_host="DHSalpha" /clone_lib="DSCT"</pre>	/organism="Collectrichum Erifolii" /mol_type="mRNA" /strain="race 1" /db_xref="taxon:5466" /clone="pDSCT2-20"	Seg primer: (gth AtA CgA CtC ACt At Location/Qualifiers 1743	Fax: 61 649 5058 Email: debbys@puccini.crl.umn.edu TIGR sequence name: MTSAB20TV More information is available at: www.mediago.org	Contact: Deborah A. The present sequence represents an internal transcribed spacer 2 (ITS2) and adjacent regions. Probes can be derived from the present sequence which are species-specific. The specification also describes ITS2 sequence-derived probes for identifying a species selected from

Claim 1; Page 12; 45pp; English.

New nucleic acid probes for filamentous fungi - for detecting e.g. Aspergillus, Fusarium, Mucor, Rhizopus, Rhizomucor, Absidia, Cunninghamella, Pseudoallescheria boydii, Penicillium and Sporothr

Sporothrix

                                                                                                                                                                                                                                                                                                                                                                                                                       This sequence represents a genomic DNA sequence containing the 18S rRNA gene, internal transcribed spacer regions 1 and 2 (ITS1, ITS2) and 5.8S rRNA sequences from a mutant strain of Gibberella fukikoroi (LIB-1027) of the invention. This region of DNA is highly variable and can be used for species and strain differentiation. The LIB-1027 mutant produces a mixture of gibberellins which is at least 70 % GA 4 and GA 7. Gibberellins GA 4 and GA 7 promotte flowering and Fruit cell elongation, and are used by growers of apples, pears and grapes to produce larger fruits and earlier harvests. The mixture of GA 3, GA 4 and GA 7 achieved using the method of this invention should be particularly useful in the apple industry where GA 4 has been found more effective in russet control and in promoting fruit set. This method produces GA 4 and GA 7 in much higher titers than prior art methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A new method for producing a mixture of gibberellins from fujikuroi results in high titers of GA4 and GA7 useful to flowering and fruit growth in the fruit growing industry.
                                                                                                                                                                                                                                                                                                                                                                                           Sequence 2293 BP; 596 A; 527 C; 592 G; 578 T; 0

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This invention relates to the detection of a fungal pathogen comprising isolating DNA from a plant leaf infected with a pathogen. The methods and primers are useful for identifying fungal isolates of fungal pathogens and monitoring of disease development in plant populations. The present sequence represents an internal transcribed spacer RNA encoding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting a fungal pathogen, useful for monitoring disease development, comprises subjecting the DNA to PCR amplification using at least one primer having sequence identity with at least 10 contiguous nucleotides of Fusarium spp.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to novel steroid compounds derived from the African CC soil fungus Fusarium sp. MF6381 (ATCC 74469) which act as inhibitors of CC HIV integrase. The invention encompasses cultures of Fusarium sp. MF6381. CC The invention also relates to a composition comprising a compound of the invention in combination with an AIDS antiviral agent, an immunomodulator CC and an antiinfective agent. The compounds of the invention may be used in the inhibition of HIV integrase and in the prevention and treatment of CC HIV infection. A wide range of state of HIV infection may be treated: CC AIDS (acquired immunodeficiency syndrome); ARC (AIDS-related complex); CC both symptomatic and asymptomatic HIV infection; and actual or potential CC exposure to HIV. The compounds may be used to isolate HIV integrase CC mutants which are potentially useful as screening tools for antiviral CC compounds. The compounds may also be used to establish or determine the cite at which other antivirals bind to HIV integrase (e.g., by CC competitive inhibition). The present sequence represents the ribosomal CC MF6381, which may be used to characterise MF6381. (Updated on 15-SEP-2003 CC to standardise OS field)

                               Ribosome RNA gene base sequence of Cordyceps sinensis for classification of seeds of Cordyceps sinensis.
                                                                                      (KANE/)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel base sequence which is part of a fully defined ribosome ribonucleic acid (rRNA) gene of Cordyceps crassispora. The base sequences can be used for the classification of Cordyceps sinensis. The sequence represents a C. crassispora rRNA sequence of the
                                                                 WPI;

                        A novel method for the detection of plant pathogenic strains of fungi e.g. Septoria nodorum, S.tritici, Pseudocercosporella herpotrichoides, Mycosphaerella fijiensis, M. musicola or Rusarium spp. involves the PCR amplification of sequences found in the internal transcribed region (ITS) of the 185, 5.85 and 285 ribosomal RNA genes by the primers AAQ94359-93 and AAT05357-72. These primers are derived from the ITS sequences of these fungi (AAT05394-T05404 and AAQ94398) and are strain specific. The amplification products of the reactions using these primers can be used with the capture primers AAT05378-93 in colourimetric assays. The primers and ITS DNAs can be used for the detection of specific fungal pathogen isolates and in monitoring disease development in plant populations

This represents the consensus DNA sequence of the internal transcribed spacer (ITS) region that was PCR amplified from Fusarium culmorum isolates, R-5106, R-5126 and R-5146. The invention provides a DNA molecule isolated from the ribosomal RNA (rRNA) gene region of a fungal pathogen, where the DNA molecule consists of an ITS sequence selected from ITS1 and ITS2 of Fusarium culmorum, Fusarium graminearum, Fusarium moniliforme, Septoria avenae or Microdochicum nivale. A method for

This sequence represents an internal transcribed spacer (ITS) sequence the invention. The primer pairs, based on the ITS sequences, are us the PCR amplification detection of wheat Microdothium and Fusarium pathogens, especially M. nivale, F. graminearum, F. culmorum, F. avenaceum, F. poae, F. moniliforme or F. roseum. The two different strains of fungi show different symptoms during infection, which ma may not be due to infection. Early identification of the strain cau
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          detecting F. graminearum, F. culmorum, F. moniliforme, F. poae, F. avenaceum and M. nivale isolates is also provided. The method comprises isolating DNA from a plant leaf infected with at least one of the above pathogens and amplifying parts of the ITS sequence of the pathogen(s) by PCR using specific primers from within these sequences. The pathogen(s) are detected by visualising the amplified part of the ITS sequence
                                                                                                Disclosure; Col 21-22; 20pp;
